3. Replace Web Application .....	3
4. Remove Indexes.....	3
5. Start intraLibrary .....	3

---

## 1. Shutdown intraLibrary

Shutdown the current instance of intraLibrary. If you are using Tomcat and are unsure about stopping and starting, see [here](#) for more help.

## 2. Update Dependencies

You need to copy dependencies from the install package *authenticationLib* directory. Instructions can be found in section 2.6 of the installation guide.

## 3. Replace Web Application

The basis of the intraLibrary web application is the *intralibrary.war file* file. You can put this archive anywhere on the server, but we'd recommended it to be on the same physical volume as the application server (Tomcat).

To avoid confusion between the new and old versions of the web application, rename the previous war file to *intralibrary\_old.war*. Once you are satisfied that the new version of intraLibrary runs correctly the old war file can be removed completely.

## 4. Remove Indexes

While not essential, we **strongly** advise that you remove the index folder from within your intraLibrary config dir. There have been instances whereby the index has become out of sync with the contents of the intralibrary database. Removing this directory will prevent any inconsistencies.

## 5. Start intraLibrary

It's now time to start the application. The first time that intraLibrary is started, any database changes will be applied on the server to ensure compatibility with the new version. The database changes are fairly minor so the amount of time taken to upgrade should be small.

If you wish to monitor the upgrade process, you can monitor the *upgradeReport.log* file

which can be found in the directory specified as 'configDir' in your properties file. This file will tell you when the process is finished by outputting the line 'finished upgrading'.

If you check the output of the server startup, you should see some text resembling the text below.

\*\*\*\*\*

populating learning object cache with 0 objects...  
finished populating learning object cache

\*\*\*\*\*

application version: n.n (nnnnn)  
database server version:5.0.27-community-nt
